The graph for theoretical result vs simulation is given below

1 PROBLEM

(GATE MA-2017 Q 50) Let E and F be any two events with $\Pr(E) = 0.4$, $\Pr(F) = 0.3$ and $\Pr(F|E) = 3 \Pr(F|E')$. Then $\Pr(E|F)$ equals

2 SOLUTION

Given

- 1) $\Pr(E) = 0.4$
- 2) $\Pr(F) = 0.3$
- 3) $\Pr(F|E) = 3 \Pr(F|E')$

From given data

$$\Pr(F|E) = 3 \Pr(F|E') \quad (2.0.1)$$

$$\frac{\Pr(FE)}{\Pr(E)} = 3 \times \frac{\Pr(FE')}{\Pr(E')} \quad (2.0.2)$$

$$\Pr(EF) = 2 \times \Pr(E'F) \quad (2.0.3)$$

We know that

$$\Pr(F) = \Pr(EF) + \Pr(E'F) \quad (2.0.4)$$

Using (2.0.3) and (2.0.4), we get

$$\Pr(F) = \frac{3}{2} \times \Pr(EF) \quad (2.0.5)$$

$$\frac{\Pr(EF)}{\Pr(F)} = \frac{2}{3} \quad (2.0.6)$$

$$\Pr(E|F) = \frac{2}{3} \approx 0.66 \quad (2.0.7)$$
